Software development of all kinds is heavily dependent on code reuse. A very common practice in software development is to reuse large quantities of existing software, but this is only possible if the source code is available. A huge part of the software community has embraced the idea of open source projects, but this is only possible if a community is able to produce (produce being an interesting term in this context, since it involves several stakeholders) code. This can be done via either industrial or academic research, but it can also be done by entrepreneurs using an Open Source development model, usually called open source development. Open source development is not always the most convenient method to develop a project or the most economical, but it is a good strategy to take a software project to an existing market and a good way to start building an open source community. An open source community is not a software development team, and it does not consist of software developers, it is a group of software developers, software designers, users, developers of other software, other fields that can contribute to open source, and also some people who are looking for a stable community where they can be productive and enjoy their work. An open source community can be based in one single individual but it is more likely to be a group of individuals. Software development starts with the idea of the project and the implementation of the project is not the only phase of the development. Open source development (this is a slightly confused term since it is not one single project but encompasses several steps) is a process where an idea or a requirement is created, and the idea needs to be developed by a set of people who have some experience in software development. A software developer can develop the idea and write the code. The Open Source community will most likely not produce a working solution of the software requirement or the software requirements are too general. At this point, an idea needs to be expressed and turned into a real project. A real project is an independent group of people that can do their own thing. It is an abstract concept, a set of people united by a set of common characteristics that can produce a specific working solution. The project needs a manager, a network, a management structure, an architectural blueprint, and a lot of time. A project manager is someone who can organize the other team members, and the project manager can either be an external person or an internal person. An external project manager is someone who works for the people who are responsible for
